Why PHP framework?

- ✓ PHP frameworks help to promote rapid application development (RAD), which saves you time, helps build more stable applications, and reduces the amount of repetitive coding for developers.
- ✓ Without a PHP Framework in place, it gets much more difficult to produce applications since you'll have to repeatedly code a lot of PHP. You'll also have to execute the connection between your database and whatever application you develop from scratch. Meanwhile, using a **PHP Framework** **makes it easier** for you to ensure this connection.

How framework works?

MVC

- ✓ MVC is an architectural pattern featured in various popular programming languages which breaks apart your domain logic from your user interface.

Now what is domain logic ?

The domain logic is the function that handles information exchange between your database and your user interface.

The **M** stands for the **raw data**, the **V** (*view/user interface*) represents what's actually being **viewed**, and **C** (*controller*) is in fact the **domain logic** as seen above.

PHP Frameworks

- ✓ Kohana
- ✓ CodeIgniter
- ✓ Akelos
- ✓ CakePHP
- ✓ Zend Framework
- ✓ Symfony
- ✓ Prado
- ✓ Solar Framework
- ✓ Yii PHP Framework
- ✓ Maintainable
- ✓ Seagull
- ✓ Fuse
- ✓ Ajax AC
- ✓ Phocoa
- ✓ Limb
- ✓ Zoop
- ✓ Blueshoes
- ✓ Qcodo
- ✓ Recess
- ✓ PHPDevShell
- ✓ Laravel

Frameworks Market Share 2017

Laravel (43.7% Market share)

CodeIgniter (14.9%)

Symfony (13.6%)

Zend (12.5%)

Yii 2(5.1 %)

CakePHP(5.5 %)

Fuel PHP(2.4 %)

FatFree(1.3%)

Aura (0.9 %)

CodeIgniter

CodeIgniter

- ✓ CodeIgniter is a powerful PHP framework with a very **small footprint**, built for developers who need a simple and elegant toolkit to create full-featured web applications. CodeIgniter was created by EllisLab, and is now a project of the British Columbia Institute of Technology.
- ✓ CodeIgniter comes with many built in libraries for unit testing, form validation, email, sessions, and much more! If you can't find a library you're looking for, it's also pretty easy to build your own, and then share it with the community.

CodeIgniter Features

- ✓ **Model-View-Controller Based System**

- ✓ **Error Handling**

It offers simple user-friendly interfaces that help you to detect error functions throughout the application globally.

- ✓ **Configuration and Customizable**

- ✓ **Migration**

Developers can manage database schema updates across various web application fields easily with helps of the migration aspect. Migration from one server to another server is simple and hassle-free in CodeIgniter.

CodeIgniter Advantages

- ✓ It helps web developers to find out the errors in programming codes and fix-up the issues instantly in the web applications.
- ✓ It provides you user-friendly interface that help developers to create a dynamic, flexible, secure and large web applications effectively in a short span of time.
- ✓ Web developers can make use of this powerful framework to customize the configuration files easily and it provides hassle-free migration from source to destination service hosting.
- ✓ The framework helps the programmer to create both front-end and rear-end of a web application effectively and easily in a secured manner.
- ✓ Programmers can create web applications with additional features and high-end functionalities by using in-built resource and libraries of the CodeIgniter.

CodeIgniter Disadvantages

- ✓ Its PHP based only and not very object-oriented in some parts.
- ✓ PHP4 legacy code.
- ✓ Company-driven instead of community-driven.
- ✓ Irregular releases.
- ✓ Framework itself has no built-in ORM (only via 3rd party solutions)

CodeIgniter File Structure

- ✓ cache: Store Web Application cache file.
- ✓ controller: Store Application Controller file.
- ✓ config: Controller: Store Application config file.
- ✓ helpers: Controller: Store Custom helper function file.
- ✓ language: Store Language file (if you want to develop application multi language).
- ✓ libraries: Store custom library file.
- ✓ logs: Store logging file.

CodeIgniter File Structure

- ✓ models: Store Application Model file.
- ✓ third_party: Store party class and function file.
- ✓ view: Store Application View file.
